

## 1. DESCRIPTION

Polarizing Plug 1-1437023-2 is used in 609, 622, and 636 Series female socket connectors where mating to a unique male connector is desired.

## 2. PROCEDURE

1. Insert one polarizing plug into the mating end of the desired circuit to be blocked.
2. Apply force until the head of the plug is flush with or below the mating face of the female socket connector.
3. Snap off the handle attached to the polarizing plug.

Repeat the process if any additional circuits are to be blocked.

The pins of the mating connector which correspond to the blocked circuits must be removed in order for the assembled female socket contact to properly mate.

## 3. REVISION SUMMARY

Since the previous version of this document, the following changes were made:

- Changed format from a 4-up version to a single-sheet document style.
- Updated document to corporate requirements.
