9216 Version 1.72 Release Notes

23 April 2018

Last Released Version:

9216 V1.71

Version 1.72 Changes

1) If updating from versions earlier than V1.71:
    a. Download firmware version 1.7001.
    b. Download firmware version 1.72.
2) Fixed issue introduced with V1.66 where for the c06 command if port was specified but not IP address the 9216 would not operate properly and require a power cycle.
3) Starting with V1.66 both destination port and IP address for the c06 command were required versus previously being optional. These parameters are now optional again.
4) Fixes w54, w55 command issue where if set default NTP server and default gateway to the same address they would forever be locked together, i.e. changing one would change both.
5) Fixes network interface to allow NTP to be accessed when in static IP address mode.

Errata

The 'b' command reply is not in the proper format and should not be used.
